报告题目: **Gosh! The Pulsar occurs “Glitch”**

报告摘要:

Abstract: Pulsars, which are known for their stable period, are highly magnetized rotating neutron stars. And it spin down gradually due to the loss of rotational kinetic energy into high-energy plasma and electromagnetic radiation. However, a sudden increase also found in the pulsars, which is so-called “glitch”. In this report, I will talk about more details of the “glitch”, the results and their physical explanations.
